## 0010PE-PE pH Minus

Version: 4

Date de révision: 20/01/2020

Page 1 de 8

Date d'impression: 07/02/2020

### SECTION 1: IDENTIFICATION DE LA SUBSTANCE ET DE LA SOCIÉTÉ/L'ENTREPRISE.

#### 1.1 Identificateur de produit.

|                      |                            |
|----------------------|----------------------------|
| Nom du produit:      | PE pH Minus                |
| Code du produit:     | 0010PE                     |
| Nom chimique:        | hydrogénosulfate de sodium |
| N. Index:            | 016-046-00-X               |
| N. CAS:              | 7681-38-1                  |
| N. CE:               | 231-665-7                  |
| N. d'enregistrement: | 01-2119552465-36-XXXX      |

#### 1.2 Utilisations identifiées pertinentes de la substance et utilisations déconseillées.

régulateur de pH

#### Usages non recommandés:

Usages différents de ceux recommandés.

Les scénarios d'exposition couvrant les utilisations se trouvent dans l'annexe.

#### 1.3 Renseignements concernant le fournisseur de la fiche de données de sécurité.

|                      |  |
|----------------------|--|
| Entreprise:          | <b>MANUFACTURAS GRE, S.A</b>           |
| Adresse:             | Aritz Bidea, 57 - Belako industrialdea |
| Ville:               | 48100 Munguia                          |
| Province ou région:  | Vizcaya (Spain)                        |

#### 1.4 Numéro d'appel d'urgence:

Anti poisoning centre:

FRANCE (Paris): 01 40 05 48 48

FRANCE (Toulouse): 05 61 77 74 47

FRANCE (Marseille): 04 91 75 25 25

ORFILA (INRS) : + 33 (0)1 45 42 59 59

BELGIQUE (Brussel): (+34) 070 245 245

### SECTION 2: IDENTIFICATION DES DANGERS.

#### 2.1 Classification de la substance.

Conformément au Règlement (UE) No 1272/2008:

Eye Dam. 1 : Provoque de graves lésions des yeux.

#### 2.2 Éléments d'étiquetage.

##### Étiquetage conformément au Règlement (UE) No 1272/2008:

Pictogrammes:

Mention d'avertissement:

**Danger**

Phrases H:

# FICHE DE DONNÉES DE SÉCURITÉ

(conformément au RÈGLEMENT (UE) 2015/830)

## 0010PE-PE pH Minus

Version: 4

Date de révision: 20/01/2020

Page 2 de 8

Date d'impression: 07/02/2020

H318      Provoque de graves lésions des yeux.

Phrases P:

- P101      En cas de consultation d'un médecin, garder à disposition le récipient ou l'étiquette.  
P102      Tenir hors de portée des enfants.  
P103      Lire l'étiquette avant utilisation.  
P280      Porter des gants de protection/des vêtements de protection/un équipement de protection des yeux/du visage.  
P305+P351+P338      EN CAS DE CONTACT AVEC LES YEUX: Rincer avec précaution à l'eau pendant plusieurs minutes. Enlever les lentilles de contact si la victime en porte et si elles peuvent être facilement enlevées. Continuer à rincer.  
P310      Appeler immédiatement un CENTRE ANTIPOISON ou un médecin.  
P501      Éliminer le contenu/récipient conformément à la réglementation.

Contient:

hydrogénosulfate de sodium

### 2.3 Autres dangers.

En conditions d'utilisation normales et dans sa forme originale, le produit n'a aucun effet négatif pour la santé et pour l'environnement.

## SECTION 3: COMPOSITION/INFORMATIONS SUR LES COMPOSANTS.

### 3.1 Substances.

Nom chimique:      hydrogénosulfate de sodium  
N. Index:      016-046-00-X  
N. CAS:      7681-38-1  
N. EC:      231-665-7  
N. d'enregistrement:      01-2119552465-36-XXXX

### 3.2 Mélanges.

Pas Applicable.

## SECTION 4: PREMIERS SECOURS.

### 4.1 Description des premiers secours.

En cas de doute ou si les symptômes persistent, demander l'assistance d'un médecin. Ne rien administrer par voie orale à une personne inconsciente.

#### En cas d'inhalation.

Mettre la victime de l'accident à l'air libre, la maintenir au chaud et en position de repos, si sa respiration est irrégulière ou s'interrompt, pratiquer sur cette dernière la technique de la respiration artificielle.

#### En cas de contact avec les yeux.

Rincer abondamment les yeux à l'eau claire et fraîche, pendant au moins 10 minutes, tout en étirant régulièrement les paupières vers le haut et demander l'aide d'un médecin. Ne pas permettre à la personne de se frotter l'œil affecté.

#### En cas de contact avec la peau.

Retirer les vêtements souillés. Nettoyer vigoureusement la peau avec de l'eau et du savon ou tout produit nettoyant adapté. NE JAMAIS utiliser de solvants ou diluants.

#### En cas d'ingestion.

En cas d'ingestion accidentelle, consulter immédiatement un médecin. Maintenir la victime en position de repos. NE JAMAIS provoquer le vomissement.

### 4.2 Principaux symptômes et effets, aigus et différés.

Produit corrosif, tout contact avec les yeux ou avec la peau peut provoquer des brûlures, l'ingestion ou l'inhalation peuvent provoquer des blessures internes. Si cela se produit, consulter immédiatement un médecin. Le contact avec les yeux peut causer des dommages irréversibles.

# FICHE DE DONNÉES DE SÉCURITÉ

(conformément au RÈGLEMENT (UE) 2015/830)

## 0010PE-PE pH Minus

Version: 4

Date de révision: 20/01/2020

Page 3 de 8

Date d'impression: 07/02/2020

### 4.3 Indication des éventuels soins médicaux immédiats et traitements particuliers nécessaires.

Consultez immédiatement un médecin. Ne rien administrer par voie orale à une personne inconsciente. Ne pas se faire vomir. Si la personne vomit, libérez les voies aériennes. Couvrir avec un pansement stérile sec. Protéger la zone affectée de la friction ou pression.

## SECTION 5: MESURES DE LUTTE CONTRE L'INCENDIE.

Le produit ne présente aucun risque particulier en cas d'incendie.

### 5.1 Moyens d'extinction.

#### Moyens d'extinction appropriés:

Extincteur de type poudre ou CO<sub>2</sub>. En cas d'incendies plus importants il est possible d'utiliser aussi la mousse résistant à l'Alcool et la pulvérisation d'eau.

#### Moyens d'extinction inappropriés:

Pour l'extinction ne jamais utiliser un jet direct d'eau. En présence de tension électrique ne pas utiliser de l'eau ou de la mousse comme moyen d'extinction.

### 5.2 Dangers particuliers résultant de la substance.

#### Risques particuliers.

Le feu peut produire une épaisse fumée noire. En conséquence de la décomposition thermique, des substances dangereuses peuvent se former: monoxyde de carbone, dioxyde de carbone. L'exposition à des substances produites suite à la combustion ou à la décomposition peut être dangereuse pour la santé.

### 5.3 Conseils aux pompiers.

Rafraîchir par pulvérisation d'eau tout réservoir, citerne ou récipient proche du feu ou de toute autre source de chaleur. Tenir compte de la direction du vent. Veiller à ce que les produits utilisés lors de l'extinction d'un incendie ne se déversent pas dans les systèmes d'évacuation d'eau, les égouts ou dans un cours d'eau.

### Équipement de protection anti-incendies.

En fonction de la magnitude ou de l'importance de l'incendie, l'utilisation de combinaisons de protection thermique, d'appareils de respiration individuels, de gants, de lunettes de protection ou de masques anatomiques faciaux et de bottes peut s'avérer nécessaire.

## SECTION 6: MESURES À PRENDRE EN CAS DE DISPERSION ACCIDENTELLE.

### 6.1 Précautions individuelles, équipement de protection et procédures d'urgence.

Pour tout contrôle d'exposition et mesures de protection individuelle, voir section 8.

### 6.2 Précautions pour la protection de l'environnement.

Éviter la pollution des systèmes d'évacuation d'eau, des sources superficielles ou souterraines, ainsi que du sol et sous-sol.

### 6.3 Méthodes et matériel de confinement et de nettoyage.

La zone polluée doit immédiatement être nettoyée à l'aide d'un décontaminant adéquat. Verser le décontaminant ainsi que les restes du produit dans un récipient ouvert, les garder ainsi pendant quelques jours jusqu'à ce que plus aucune réaction ne se produise.

### 6.4 Référence à d'autres sections.

Pour tout contrôle d'exposition et mesures de protection individuelle, voir section 8.

Pour l'ultérieure élimination des résidus, se reporter aux recommandations décrites dans l'section 13.

## SECTION 7: MANIPULATION ET STOCKAGE.

### 7.1 Précautions à prendre pour une manipulation sans danger.

Pour la protection personnelle se reporter à l'section 8. Ne jamais utiliser la pression pour vider les containers, ces derniers n'ayant pas été conçus pour résister à la pression.

Il est formellement interdit de fumer, manger ou boire dans la zone d'application du produit.

# FICHE DE DONNÉES DE SÉCURITÉ

(conformément au RÈGLEMENT (UE) 2015/830)

## 0010PE-PE pH Minus

Version: 4

Date de révision: 20/01/2020

Page 4 de 8

Date d'impression: 07/02/2020

Respecter la législation relative à la Sécurité et à l'Hygiène dans le cadre du travail.  
Conserver le produit dans un récipient de même matériau que le récipient ou conteneur original.

### 7.2 Conditions d'un stockage sûr, y compris d'éventuelles incompatibilités.

Magasiner le produit en accord avec la législation locale correspondante. Tenir compte des indications portées sur l'étiquette. Conserver les containers à température ambiante, dans un endroit sec et bien aéré, à l'écart de toute source de chaleur et protégé de la lumière du soleil. Garder à l'écart de toute flamme. Éloigner de tout agent oxydant ou matériau hautement acide ou alcalin. Ne pas fumer. Refuser l'accès au personnel non autorisé. Une fois ouvert, tout container doit être précautionnement refermé et positionné verticalement afin d'éviter toute chute ou renversement.

Le produit n'est pas affecté par la Directive 2012/18/UE (SEVESO III).

### 7.3 Utilisation(s) finale(s) particulière(s).

Aucune utilisation particulière

## SECTION 8: CONTRÔLES DE L'EXPOSITION/PROTECTION INDIVIDUELLE.

### 8.1 Paramètres de contrôle.

Le produit NE contient PAS de substances avec des Valeurs Limites Environnementale d'Exposition Professionnelle. Le produit ne contient pas de substances avec des Valeurs Limites Biologiques.

### 8.2 Contrôles de l'exposition.

#### Mesures d'ordre technique:

Prévoir un système d'aération adapté, au moyen de l'installation d'une unité d'extraction- ventilation locale ainsi que d'un système général d'extraction.

|   |   |                                    |                                  |  |  |  |
|---|---|------------------------------------|----------------------------------|--|--|--|
| <b>Concentration:</b>   | 100 %   |                                    |                                  |  |  |  |
| <b>Utilisation(s):</b>  | régulateur de pH  |                                    |                                  |  |  |  |
| <b>Protection respiratoire:</b>   |   |                                    |                                  |  |  |  |
| Si l'on applique les mesures techniques recommandées, il n'est pas nécessaire de porter un équipement de protection individuelle. |   |                                    |                                  |  |  |  |
| <b>Protection des mains:</b>  |   |                                    |                                  |  |  |  |
| PPE:  | Gants de protection   |                                    |                                  |  |  |  |
| Caractéristiques:   | Marquage «CE» Catégorie II.   |                                    |                                  |  |  |  |
| Normes CEN:   | EN 374-1, EN 374-2, EN 374-3, EN 420  |                                    |                                  |  |  |  |
| Maintenance:  | Conserver dans un endroit sec, à l'abri d'une quelconque source de chaleur, et des rayons du soleil. Ne pas modifier les gants pour éviter d'altérer leur résistance. Ne pas appliquer de peinture, de dissolvant ou d'adhésif. |                                    |                                  |  |  |  |
| Observations:   | Les gants doivent être de la bonne taille et s'ajuster à la main sans être trop serrés ni trop lâches. Les gants doivent toujours être portés avec les mains propres et sèches.   |                                    |                                  |  |  |  |
| Matériaux:  | PVC (Polychlorure de vinyle)  | Temps de pénétration (min.): > 480 | Epaisseur du matériau (mm): 0,35 |  |  |  |
| <b>Protection des yeux:</b>   |   |                                    |                                  |  |  |  |
| PPE:  | Lunettes de protection avec monture intégrale   |                                    |                                  |  |  |  |
| Caractéristiques:   | Marquage «CE» Catégorie II. Lunettes de protection avec monture intégrale pour se protéger contre la poussière, la fumée, les brouillards et les vapeurs.   |                                    |                                  |  |  |  |
| Normes CEN:   | EN 165, EN 166, EN 167, EN 168  |                                    |                                  |  |  |  |
| Maintenance:  | La visibilité au travers des lunettes doit être optimale, c'est pourquoi il faut les nettoyer tous les jours et les désinfecter régulièrement, conformément aux instructions du fabricant.                                      |                                    |                                  |  |  |  |
| Observations:   | Indicateurs de détérioration tels que: lunettes présentant une couleur jaunâtre, des rayures superficielles ou plus profondes, etc.   |                                    |                                  |  |  |  |
| <b>Protection de la peau:</b>   |   |                                    |                                  |  |  |  |
| PPE:  | Vêtements de protection   |                                    |                                  |  |  |  |
| Caractéristiques:   | Marquage «CE» Catégorie II. Les vêtements de protection ne doivent pas être portés trop serrés ou trop lâches, pour ne pas gêner les mouvements de l'utilisateur.   |                                    |                                  |  |  |  |
| Normes CEN:   | EN 340  |                                    |                                  |  |  |  |
| Maintenance:  | Appliquer les instructions de lavage et de conservation fournies par le fabricant pour garantir une protection invariable.  |                                    |                                  |  |  |  |

# FICHE DE DONNÉES DE SÉCURITÉ

(conformément au RÈGLEMENT (UE) 2015/830)

## 0010PE-PE pH Minus

Version: 4

Date de révision: 20/01/2020

Page 5 de 8

Date d'impression: 07/02/2020

|                   |  |
|-------------------|--|
| Observations:     | Les vêtements de protection devraient être confortables et protéger contre le risque pour lesquels ils ont été prévus, avec les conditions environnementales, le niveau d'activité de l'utilisateur et le temps d'utilisation prévus.                                    |
| PPE:              | Chaussures de travail  |
| Caractéristiques: | Marquage «CE» Catégorie II.  |
| Normes CEN:       | EN ISO 13287, EN 20347   |
| Maintenance:      | Ces articles s'adaptent à la forme du pied du premier utilisateur. C'est pour cette raison, mais aussi pour des questions d'hygiène qu'il faut éviter qu'une autre personne les réutilise.   |
| Observations:     | Les chaussures de travail à usage professionnel incorporent des éléments de protection destinés à protéger l'utilisateur contre des blessures qui peuvent provoquer des accidents. Il faut contrôler quelles tâches et quelles activités sont adaptées à ces chaussures. |

## SECTION 9: PROPRIÉTÉS PHYSIQUES ET CHIMIQUES.

### 9.1 Informations sur les propriétés physiques et chimiques essentielles.

Aspect:Solide

Couleur: Légèrement jaune

Odeur:Inodore

Seuil olfactif:P.D./P.A.

pH:P.D./P.A.

Point de fusion:180 °C

Point d'ébullition: >200 °C

Point d'inflammation: P.D./P.A.

Taux d'évaporation: P.D./P.A.

Inflammabilité (solide, gaz): P.D./P.A.

Limite inférieure d'explosivité: P.D./P.A.

Limite supérieure d'explosivité: P.D./P.A.

Pression de vapeur: P.D./P.A.

Densité de la vapeur:P.D./P.A.

Densité relative:1.4 - 1.45 g/cm<sup>3</sup>

Solubilité:P.D./P.A.

Liposolubilité: P.D./P.A.

Hydro solubilité: 1080 g/l (20 °C)

Coefficient de partage (n-octanol/eau): P.D./P.A.

Température d'auto inflammabilité: P.D./P.A.

Température de décomposition: P.D./P.A.

Viscosité: P.D./P.A.

Propriétés explosives: P.D./P.A.

Propriétés comburantes: No

P.D./P.A.= Pas Disponible/Pas Applicable en raison de la nature du produit.

### 9.2 Autres informations.

Point d'écoulement: P.D./P.A.

Scintillation: P.D./P.A.

Viscosité cinématique: P.D./P.A.

P.D./P.A.= Pas Disponible/Pas Applicable en raison de la nature du produit.

## SECTION 10: STABILITÉ ET RÉACTIVITÉ.

### 10.1 Réactivité.

Le produit ne présente pas de danger par leur réactivité.

### 10.2 Stabilité chimique.

Stable dans les conditions de manipulation et de conservation recommandées (voir épigraphhe 7).

### 10.3 Possibilité de réactions dangereuses.

Le produit ne présentent possibilité de réactions dangereuses.

### 10.4 Conditions à éviter.

Eviter tout type de manipulation incorrecte

# FICHE DE DONNÉES DE SÉCURITÉ

(conformément au RÈGLEMENT (UE) 2015/830)

## 0010PE-PE pH Minus

Version: 4

Date de révision: 20/01/2020

Page 6 de 8

Date d'impression: 07/02/2020

### 10.5 Matières incompatibles.

Maintenir éloigné tout agent oxydant ou matériau hautement alcalin ou acide, afin d'éviter une réaction exothermique.

### 10.6 Produits de décomposition dangereux.

Aucune décomposition se présente, si c'est utilisé dans les conditions recommandées

## SECTION 11: INFORMATIONS TOXICOLOGIQUES.

### 11.1 Informations sur les effets toxicologiques.

Un contact prolongé ou répété avec le produit peut donner lieu à une élimination de la graisse de la peau, susceptible de provoquer une dermatose de contact non allergique et permettant l'absorption du produit par la peau.

#### Information Toxicologique.

| Nom   | Toxicité aigüe |       |        |                 |
|---|----------------|-------|--------|-----------------|
|   | Type           | Essai | Espèce | Valeur          |
| hydrogénosulfate de sodium<br><br>CAS No: 7681-38-1      EC No: 231-665-7 | Oral           | LD50  | Rat    | 2140 mg/kg      |
|   | Cutané         |       |        |                 |
|   | Inhalation     | LD50  | Rat    | >2.4 mg/l (4 h) |

a) toxicité aigüe;

Données non concluantes pour la classification.

b) corrosion cutanée/irritation cutanée;

Données non concluantes pour la classification.

c) lésions oculaires graves/irritation oculaire;

Produit classé:

Lésions oculaires graves, Catégorie 1: Provoque de graves lésions des yeux.

d) sensibilisation respiratoire ou cutanée;

Données non concluantes pour la classification.

e) mutagénicité sur les cellules germinales;

Données non concluantes pour la classification.

f) cancérogénicité;

Données non concluantes pour la classification.

g) toxicité pour la reproduction;

Données non concluantes pour la classification.

h) toxicité spécifique pour certains organes cibles - exposition unique;

Données non concluantes pour la classification.

i) toxicité spécifique pour certains organes cibles – exposition répétée;

Données non concluantes pour la classification.

j) danger par aspiration.

Données non concluantes pour la classification.

## SECTION 12: INFORMATIONS ÉCOLOGIQUES.

### 12.1 Toxicité.

|   | Plantes aquatiques     | LC50 | Algae   | 1900 mg/l (120 h) |

### 12.2 Persistance et dégradabilité.

Il n'y a pas d'information sur la biodégradabilité des substances présentes.

Il n'y a pas d'information sur la dégradabilité des substances présentes. Aucune information n'est disponible sur la persistance et la dégradabilité du produit..

### 12.3 Potentiel de bioaccumulation.

On ne dispose pas d'information relative à la Bioaccumulation.

### 12.4 Mobilité dans le sol.

Aucune information n'est disponible sur la mobilité dans le sol.

Il est donc essentiel d'éviter à tout prix qu'il ne se déverse dans les égouts ou cours d'eau.

Éviter qu'il ne pénètre dans le sol.

### 12.5 Résultats des évaluations PBT et vPvB.

Aucune information n'est disponible sur les résultats de l'évaluation PBT et vPvB du produit.

### 12.6 Autres effets néfastes.

Aucune information n'est disponible sur d'autres effets néfastes pour l'environnement.

## SECTION 13: CONSIDÉRATIONS RELATIVES À L'ÉLIMINATION.

### 13.1 Méthodes de traitement des déchets.

Il est interdit de le déverser dans les égouts ou cours d'eau. Les résidus et containers vides doivent être manipulés et éliminés en accord avec la législation locale / nationale correspondante en vigueur.

Suivre les dispositions de la Directive 2008/98/CE relative à la gestion des déchets.

## SECTION 14: INFORMATIONS RELATIVES AU TRANSPORT.

Transport non-dangereux. En cas d'accident et de renversement du produit, procéder conformément au point 6.

### 14.1 Numéro ONU.

Transport non-dangereux.

### 14.2 Nom d'expédition des Nations unies.

Description:

ADR: Transport non-dangereux.

IMDG: Transport non-dangereux.

OACI/IATA: Transport non-dangereux.

### 14.3 Classe(s) de danger pour le transport.

Transport non-dangereux.

### 14.4 Groupe d'emballage.

Transport non-dangereux.

### 14.5 Dangers pour l'environnement.

Transport non-dangereux.

### 14.6 Précautions particulières à prendre par l'utilisateur.

Transport non-dangereux.

### 14.7 Transport en vrac conformément à l'annexe II de la convention MARPOL et au recueil IBC.

# FICHE DE DONNÉES DE SÉCURITÉ

(conformément au RÈGLEMENT (UE) 2015/830)

## 001OPE-PE pH Minus

Version: 4

Date de révision: 20/01/2020

Page 8 de 8

Date d'impression: 07/02/2020

Transport non-dangereux.

### SECTION 15: INFORMATIONS RÉGLEMENTAIRES.

#### 15.1 Réglementations/législation particulières à la substance en matière de sécurité, de santé et d'environnement.

Le produit n'est pas affecté par le Règlement (CE) no 1005/2009 du Parlement européen et du Conseil du 16 septembre 2009 relatif à des substances qui appauvrisse la couche d'ozone.

Classification du produit en accord avec l'Annexe I de la Directive 2012/18/UE (SEVESO III): N/A

Le produit n'est pas affecté par le Règlement (UE) No 528/2012 relatif à la commercialisation et à l'utilisation des biocides.

Le produit ne se trouve pas affecté par le processus établi dans le Règlement (UE) No 649/2012, relatif à l'exportation et à l'importation de produits chimiques dangereux.

Classe de contamination de l'eau (Allemagne): WGK 1: Peu dangereux pour l'eau. (Auto classé selon le Règlement AwSV)

#### 15.2 Évaluation de la sécurité chimique.

Il n'a pas procédé à une évaluation de la sécurité chimique du produit.

Est disponible un Scénario d'Exposition du produit.

### SECTION 16: AUTRES INFORMATIONS.

Codes de classification:

Eye Dam. 1 : Lésions oculaires graves, Catégorie 1

Il est recommandé de suivre une formation basique sur la sécurité et l'hygiène au travail, pour pouvoir manipuler correctement le produit.

Est disponible un Scénario d'Exposition du produit.

Abréviations et acronymes utilisés:

AwSV: Règlement d'Installations pour la manipulation de substances dangereuses pour l'eau.

CEN: Comité européen de normalisation.

EC50: Concentration efficace moyenne.

PPE: Équipements de protection individuelle.

LC50: Concentration létale, 50%.

LD50: Dose létale, 50%.

WGK: Classes de danger lié à l'eau.

## 9.1 Manufacture and use of sodium hydrogensulfate as such or in preparation in industrial settings

| Exposure Scenario Format (1) addressing uses carried out by workers   |  |                        |                  |                    |  |  |  |  |  |
|---|--|------------------------|------------------|--------------------|--|--|--|--|--|
| 1. Title  |  |                        |                  |                    |  |  |  |  |  |
| Free short title  | Manufacture and use of sodium hydrogensulfate as such or in preparation in industrial settings   |                        |                  |                    |  |  |  |  |  |
| Systematic title based on use descriptor  | SU2a, SU2b, SU3, SU4, SU5, SU6b, SU7, SU8, SU9, SU10, SU11, SU13, SU15, SU16, SU17, SU19, SU20, SU23<br>PC1PC14, PC15, PC19, PC20, PC21, PC25, PC35, PC36, PC37<br>PROC1, PROC2, PROC3, PROC4, PROC5, PROC7, PROC8a, PROC8b, PROC9, PROC10, PROC12, PROC13, PROC14, PROC15, PROC17, PROC19, PROC21, PROC24<br>ERC1-7, 12 |                        |                  |                    |  |  |  |  |  |
| Processes, tasks and/or activities covered  | Processes, tasks and/or activities covered are described in Section 2 below.   |                        |                  |                    |  |  |  |  |  |
| Assessment Method   | Occupational exposure: A qualitative assessment of inhalation and dermal exposure was conducted in the absence of any DNELs (derived no-effect levels) for inhalation and dermal exposure.<br>Environmental exposure: A qualitative assessment was conducted.  |                        |                  |                    |  |  |  |  |  |
| 2. Operational conditions and risk management measures  |  |                        |                  |                    |  |  |  |  |  |
| 2.1 Control of workers exposure   |  |                        |                  |                    |  |  |  |  |  |
| Product characteristic  |  |                        |                  |                    |  |  |  |  |  |
| Sodium hydrogensulfate is produced and placed on the market as a pearled/granular product or in preparations having the same physical form. The rotating drum method (RDM) according to Heubach was used to determine the particle size distribution of the airborne fraction of dust generated during mechanical agitation simulating workplace conditions. This method provides a "total dustiness" value indicating the propensity of a material to become airborne, and thus serving as an indicator of the emission potential of the material under workplace conditions. The test resulted in a total dustiness of sodium hydrogensulfate of 0.8 % when simulating mechanical agitation (e.g. bagging, filling and mixing operations). According to the MEASE approach, the substance intrinsic emission potential could be assessed as very low – low.<br>Thus, inhalation exposure to sodium hydrogensulfate is assumed to be negligible during all process steps in industrial and/or professional settings and the inhalation route is not a relevant exposure route for this substance. Under the prerequisite that all available (i.e. purchasable) forms of sodium hydrogensulfate are in accordance with the dustiness as documented above, human health is thereby considered to be sufficiently protected.<br>It is noted that the substance intrinsic emission potential may be overwritten for specific processes by the process intrinsic emission potential. PROC 7 and PROC 11 as being spray applications in industrial and non-industrial settings, respectively, are assumed to result in a higher emission potential (it is also assumed that the physical form has to be modified to powder prior to spraying). Since PROC 21 and PROC 24 are considered as potential abrasive tasks, the emission potential is accordingly higher and the physical form is assumed to be wear dust during these tasks. |  |                        |                  |                    |  |  |  |  |  |
| PROC  | Use in preparation   | Content in preparation | Physical form    | Emission potential |  |  |  |  |  |
| PROC 7  | not restricted   |                        | powder           | medium             |  |  |  |  |  |
| PROC 21, 24   |  |                        | (wear) dust      | low – high         |  |  |  |  |  |
| All other applicable PROCs  |  |                        | pearls, granules | very low – low     |  |  |  |  |  |
| Amounts used  |  |                        |                  |                    |  |  |  |  |  |
| The actual tonnage handled per shift is not considered to influence the exposure as such for this scenario. Instead, the combination of the scale of operation (industrial vs. professional) and level of containment/automation (as reflected in the PROC) is the main determinant of the process intrinsic emission potential.  |  |                        |                  |                    |  |  |  |  |  |
| Frequency and duration of use/exposure  |  |                        |                  |                    |  |  |  |  |  |
| PROC  | Duration of exposure   |                        |                  |                    |  |  |  |  |  |
| PROC 7  | Due to the high level of automation and measures at the process level (please see below), inhalation exposure is negligible and the exposure duration is consequently short (< 60 minutes).  |                        |                  |                    |  |  |  |  |  |
| All other applicable PROCs  | not restricted   |                        |                  |                    |  |  |  |  |  |
| Human factors not influenced by risk management   |  |                        |                  |                    |  |  |  |  |  |
| The shift breathing volume during all process steps reflected in the PROCs is assumed to be 10 m <sup>3</sup> /shift (8 hours).   |  |                        |                  |                    |  |  |  |  |  |
| Other given operational conditions affecting workers exposure   |  |                        |                  |                    |  |  |  |  |  |
| Other operational conditions such as room volume, indoor or outdoor use, process temperature and process pressure are not considered relevant for the occupational exposure assessment of the conducted processes.  |  |                        |                  |                    |  |  |  |  |  |

## Exposure scenario addendum for sodium hydrogensulfate

| Technical conditions and measures at process level (source) to prevent release  |  |   |  |  |  |  |  |
|---|--|---|--|--|--|--|--|
| PROC  | Level of containment   | Level of segregation  |  |  |  |  |  |
| PROC 1, 2, 3  | closed process   | not required  |  |  |  |  |  |
| PROC 7  | closed process   | spraying of sodium hydrogensulfate in a segregated spray tower where direct exposure of the worker is excluded  |  |  |  |  |  |
| All other applicable PROCs  |  |   |  |  |  |  |  |
| Risk management measures at the process level (e.g. containment or segregation of the emission source) are generally not required in these processes since any potential inhalation exposure is assumed to be negligible due to the low dusty nature of sodium hydrogensulfate.   |  |   |  |  |  |  |  |
| Technical conditions and measures to control dispersion from source towards the worker  |  |   |  |  |  |  |  |
| PROC  | Level of separation  | Localised controls (LC)   | Efficiency of LC (according to MEASE)  | Further information  |  |  |  |
| PROC 7  | Any potentially required separation of workers from the emission source is indicated above under "Frequency and duration of exposure". A reduction of exposure duration can be achieved, for example, by the installation of ventilated (positive pressure) control rooms or by removing the worker from workplaces involved with relevant exposure. | Efficient ventilation of the area (e.g. local exhaust ventilation) is recommended to minimise any potential emission of wear dust into workplace air. | 78 %   | -  |  |  |  |
| All other applicable PROCs  | Separation of workers from the emission source is generally not required in the conducted processes.   |   |  |  |  |  |  |
| Organisational measures to prevent /limit releases, dispersion and exposure   |  |   |  |  |  |  |  |
| Avoid inhalation or ingestion. General occupational hygiene measures are required to ensure safe handling of the substance. Good occupational hygiene practices have to be followed (e.g. shower and change clothes at end of work shift) to avoid any contamination of private households via the work-home-interface. Do not eat and smoke in the workplace. Unless otherwise stated below, wear standard working clothes and shoes. Do not wear contaminated clothing at home. Do not blow dust off with compressed air. Regular training in workplace hygiene practice and proper use of personal protective equipment is required. |  |   |  |  |  |  |  |
| Conditions and measures related to personal protection, hygiene and health evaluation   |  |   |  |  |  |  |  |
| PROC  | Specification of respiratory protective equipment (RPE)  | RPE efficiency (assigned protection factor, APF)  | Specification of gloves  | Further personal protective equipment (PPE)  |  |  |  |
| All applicable PROCs  | If ventilation is insufficient and/or formation of relevant dust levels cannot be excluded, use RPE according to EN143 and EN149. An FFP2 mask should be worn for safety reasons when packaging/unpacking sodium hydrogensulfate since high abrasion may occur.  | (APF=10, for safety reasons during processes where relevant dust levels and high abrasion may occur)  | In cases where extensive direct contact with sodium hydrogensulfate cannot be avoided, wear suitable protective gloves according to EN374. | Eye protection equipment (e.g. goggles or visors) conforming to EN166 must be worn, unless potential contact with the eye can be excluded by the nature and type of application (i.e. closed process). Additionally, face protection, protective clothing and safety shoes are required to be worn as appropriate. |  |  |  |
| Any RPE as defined above shall only be worn if the following principles are implemented in parallel: The duration of work (compare with "duration of exposure" above) should reflect the additional physiological stress for the worker due to the breathing resistance and mass of the RPE itself, due to the increased thermal stress by enclosing the head. In addition, it shall be considered that the worker's capability of using tools and of communicating are reduced during the wearing of RPE.  |  |   |  |  |  |  |  |
| For reasons as given above, the worker should therefore be (i) healthy (especially in view of medical problems that may affect the use of RPE), (ii) have suitable facial characteristics reducing leakages between face and mask (in view of scares and facial hair). The recommended devices above which rely on a tight face seal will not provide the required protection unless they fit the contours of the face properly and securely.   |  |   |  |  |  |  |  |
| The employer and self-employed persons have legal responsibilities for the maintenance and issue of respiratory protective devices and the management of their correct use in the workplace. Therefore, they should define and document a suitable policy for a respiratory protective device programme including training of the workers.  |  |   |  |  |  |  |  |
| An overview of the APFs of different RPE (according to BS EN 529:2005) can be found in the glossary of MEASE.   |  |   |  |  |  |  |  |

| 2.2 Control of environmental exposure  |   |                                    |   |                                |
|--|---|------------------------------------|---|--------------------------------|
| <b>Amounts used</b>  |   |                                    |   |                                |
| The daily and annual amount per site (for point sources) is not considered to be the main determinant for environmental exposure.  |   |                                    |   |                                |
| <b>Frequency and duration of use</b>   |   |                                    |   |                                |
| Intermittent (< 12 time per year) or continuous use/release  |   |                                    |   |                                |
| <b>Environment factors not influenced by risk management</b>   |   |                                    |   |                                |
| Flow rate of receiving surface water: 18000 m3/day   |   |                                    |   |                                |
| <b>Other given operational conditions affecting environmental exposure</b>   |   |                                    |   |                                |
| Effluent discharge rate: 2000 m3/day   |   |                                    |   |                                |
| <b>Technical onsite conditions and measures to reduce or limit discharges, air emissions and releases to soil</b>  |   |                                    |   |                                |
| Risk management measures related to the environment aim to avoid discharging NaHSO <sub>4</sub> solutions into municipal wastewater or to surface water, in case such discharges are expected to cause significant pH changes regular control of the pH value during introduction into open waters is required. In general discharges should be carried out such that pH changes in receiving surface waters are minimised (e.g. through neutralisation). In general most aquatic organisms can tolerate pH values in the range of 6-9. This is also reflected in the description of standard OECD tests with aquatic organisms. Neutralisation of waste waters and effluent should be widespread (often it is also required by national legislation). |   |                                    |   |                                |
| <b>Conditions and measures related to waste</b>  |   |                                    |   |                                |
| Solid industrial waste of NaHSO <sub>4</sub> should be reused or discharged to the industrial wastewater and further neutralized if needed.  |   |                                    |   |                                |
| 3. Exposure estimation and reference to its source   |   |                                    |   |                                |
| <b>Occupational exposure</b>   |   |                                    |   |                                |
| PROC   | Method used for inhalation exposure assessment (refer to introduction)  | Inhalation exposure estimate (RCR) | Method used for dermal exposure assessment  | Dermal exposure estimate (RCR) |
| All applicable PROCs   | Since sodium hydrogensulfate has a low dustiness (<1 % as obtained in rotating drum testing), inhalation exposure during all process steps is assumed to be negligible if the proposed risk management measures as described above are met. |                                    | Due to the negligible dermal absorption of sodium hydrogensulfate, the dermal route is not a relevant exposure path for sodium hydrogensulfate and a dermal DNEL has not been derived. Thus, dermal exposure is not assessed in this exposure scenario. |                                |

## Exposure scenario addendum for sodium hydrogensulfate

| <b>Environmental emissions</b>  |   |
|---|---|
| The environmental exposure assessment is only relevant for the aquatic environment, when applicable including STPs/WWTPs, as emissions of NaHSO <sub>4</sub> in the different life-cycle stages (production and use) mainly apply to (waste) water. The aquatic effect and risk assessment only deal with the effect on organisms/ecosystems due to possible pH changes related to H <sup>+</sup> discharges, being the toxicity of Na <sup>+</sup> and SO <sub>4</sub> <sup>2-</sup> are expected to be negligible compared to the (potential) pH effect. Only the local scale is addressed, including municipal sewage treatment plants (STPs) or industrial waste water treatment plants (WWTPs) when applicable, both for production and industrial use as any effects that might occur would be expected to take place on a local scale. The high water solubility and very low vapour pressure indicate that NaHSO <sub>4</sub> will be found predominantly in water. Significant emissions or exposure to air are not expected due to the low vapour pressure of NaHSO <sub>4</sub> . Significant emissions or exposure to the terrestrial environment are not expected either for this exposure scenario. |   |
| <b>Environmental emissions</b>  | The production or use of NaHSO <sub>4</sub> can potentially result in an aquatic emission and locally increase the NaHSO <sub>4</sub> concentration and affect the pH in the aquatic environment. When the pH is not neutralised, the discharge of effluent from NaHSO <sub>4</sub> production or use sites may impact the pH in the receiving water. The pH of effluents is normally measured very frequently and can be neutralised easily as often required by national laws.  |
| <b>Exposure concentration in waste water treatment plant (WWTP)</b>   | Waste water from NaHSO <sub>4</sub> production or use is an inorganic wastewater stream and therefore there is no biological treatment. Therefore, wastewater streams from NaHSO <sub>4</sub> production sites will normally not be treated in biological waste water treatment plants (WWTPs).   |
| <b>Exposure concentration in aquatic pelagic compartment</b>  | When NaHSO <sub>4</sub> is emitted to surface water, sorption to particulate matter and sediment will be negligible. When NaHSO <sub>4</sub> is rejected to surface water, the pH may decrease, depending on the buffer capacity of the water. The higher the buffer capacity of the water, the lower the effect on pH will be. In general the buffer capacity preventing shifts in acidity or alkalinity in natural waters is regulated by the equilibrium between carbon dioxide (CO <sub>2</sub> ), the bicarbonate ion (HCO <sub>3</sub> <sup>-</sup> ) and the carbonate ion (CO <sub>3</sub> <sup>2-</sup> ). |
| <b>Exposure concentration in sediments</b>  | The sediment compartment is not included in this ES, because it is not considered relevant for NaHSO <sub>4</sub> : when NaHSO <sub>4</sub> is emitted to the aquatic compartment, sorption of to sediment particles is negligible.   |
| <b>Exposure concentrations in soil and groundwater</b>  | The terrestrial compartment is not included in this exposure scenario, because it is not considered to be relevant.   |
| <b>Exposure concentration in atmospheric compartment</b>  | The air compartment is not included in this CSA because it is considered not relevant for NaHSO <sub>4</sub> .  |
| <b>Exposure concentration relevant for the food chain (secondary poisoning)</b>   | Bioaccumulation in organisms is not relevant for NaHSO <sub>4</sub> : a risk assessment for secondary poisoning is therefore not required.  |
| <b>4. Guidance to DU to evaluate whether he works inside the boundaries set by the ES</b>   |   |
| <b>Occupational exposure</b>  |   |
| The DU works inside the boundaries set by the ES if he handles sodium hydrogensulfate having the same properties with regard to dustiness as described in this ES and if the proposed risk management measures as described above are met. A dustiness assessment can be made either on a qualitative or on a quantitative basis. For a qualitative assessment the MEASE glossary ( <a href="http://www.ebrc.de/mease.html">www.ebrc.de/mease.html</a> ) can be consulted, which provides guidance on this topic. A quantitative assessment can be done by conducting a dustiness test with the specific material according to the rotating drum method. It is however noted that also other dustiness tests exist, which may be used instead. For further details please refer to the European Standard EN 15051 titled "Workplace atmospheres – Measurement of the dustiness of bulk materials – Requirements and reference test methods".  |   |

### Environmental emissions

If a site does not comply with the conditions stipulated in the safe use ES, it is recommended to apply a tiered approach to perform a more site-specific assessment. For that assessment, the following tiered approach is recommended.

**Tier 1:** retrieve information on effluent pH and the contribution of NaHSO<sub>4</sub> on the resulting pH. Shall the pH be below 6 and predominantly dependent by the NaHSO<sub>4</sub>, than further actions are required to demonstrate safe use.

**Tier 2a:** retrieve information on receiving water pH after the discharge point. The pH of the receiving water shall not be lower then 6. If the measures are not available, the pH in the river can be calculated as follows:

$$pH_{River} = \log \left[ \frac{Q_{effluent} * 10^{pH_{effluent}} + Q_{riverupstream} * 10^{pH_{upstream}}}{Q_{riverupstream} + Q_{effluent}} \right]$$

(Eq 1)

Where:

Q effluent refers to the effluent flow (in m<sup>3</sup>/day)

Q river upstream refers to the upstream river flow (in m<sup>3</sup>/day)

pH effluent refers to the pH of the effluent

pH upstream river refers to the pH of the river upstream of the discharge point

Please note that initially, default values can be used:

- Q river upstream flows: use the 10th of existing measurements distribution or use default value of 18000 m<sup>3</sup>/day
- Q effluent: use default value of 2000 m<sup>3</sup>/day
- The upstream pH is preferably a measured value. If not available, one can assume a neutral pH of 7 if this can be justified.

Such equation has to be seen as a worst case scenario, where water conditions are standard and not case specific.

**Tier 2b:** Equation 1 can be used to identify which effluent pH causes an acceptable pH level in the receiving body. In order to do so, pH of the river is set at value 6 and pH of the effluent is calculated accordingly (using default values as reported previously, if necessary). As temperature influences solubility, pH effluent might require to be adjusted on a case-by-case basis. Once the maximum admissible pH value in the effluent is established, it is assumed that the H<sup>+</sup> concentrations are all dependent on NaHSO<sub>4</sub> discharge and that there is no buffer capacity conditions to consider (this is a unrealistic worst case scenario, which can be modified where information is available). Maximum load of NaHSO<sub>4</sub> that can be annually rejected without negatively affecting the pH of the receiving water is calculated assuming chemical equilibrium. H<sup>+</sup> expressed as moles/litre is multiplied by average flow of the effluent and then divided by the molar mass of NaHSO<sub>4</sub>.

**Tier 3:** measure the pH in the receiving water after the discharge point. If pH is between 6 and 9, safe use is reasonably demonstrated and the ES ends here. If pH is found to be below 6, risk management measures have to be implemented: the effluent has to undergo neutralisation, thus ensuring safe use of NaHSO<sub>4</sub> during production or use phase.

## 9.2 Use of sodium hydrogensulfate as such or in preparation in professional settings

| Exposure Scenario Format (1) addressing uses carried out by workers   |   |                        |                  |                    |  |  |  |  |  |

| Systematic title based on use descriptor  | SU22<br>PC14, PC15, PC20, PC35, PC37<br>PROC2, PROC3, PROC4, PROC5, PROC8a, PROC8b, PROC9, PROC10, PROC11, PROC12, PROC13,<br>PROC14, PROC15, PROC17, PROC19, PROC21, PROC24<br>ERC8-11   |                        |                  |                    |  |  |  |  |  |
| Processes, tasks and/or activities covered  | Processes, tasks and/or activities covered are described in Section 2 below.  |                        |                  |                    |  |  |  |  |  |
| Assessment Method   | Occupational exposure: A qualitative assessment of inhalation and dermal exposure was conducted in the absence of any DNELs (derived no-effect levels) for inhalation and dermal exposure.<br>Environmental exposure: A qualitative assessment was conducted. |                        |                  |                    |  |  |  |  |  |
| 2. Operational conditions and risk management measures  |   |                        |                  |                    |  |  |  |  |  |
| 2.1 Control of workers exposure   |   |                        |                  |                    |  |  |  |  |  |
| Product characteristic  |   |                        |                  |                    |  |  |  |  |  |
| Sodium hydrogensulfate is produced and placed on the market as a pearled/granular product or in preparations having the same physical form. The rotating drum method (RDM) according to Heubach was used to determine the particle size distribution of the airborne fraction of dust generated during mechanical agitation simulating workplace conditions. This method provides a "total dustiness" value indicating the propensity of a material to become airborne, and thus serving as an indicator of the emission potential of the material under workplace conditions. The test resulted in a total dustiness of sodium hydrogensulfate of 0.8 % when simulating mechanical agitation (e.g. bagging, filling and mixing operations). According to the MEASE approach, the substance intrinsic emission potential could be assessed as very low – low.<br>Thus, inhalation exposure to sodium hydrogensulfate is assumed to be negligible during all process steps in industrial and/or professional settings and the inhalation route is not a relevant exposure route for this substance. Under the prerequisite that all available (i.e. purchasable) forms of sodium hydrogensulfate are in accordance with the dustiness as documented above, human health is thereby considered to be sufficiently protected.<br>It is noted that the substance intrinsic emission potential may be overwritten for specific processes by the process intrinsic emission potential. PROC 7 and PROC 11 as being spray applications in industrial and non-industrial settings, respectively, are assumed to result in a higher emission potential (it is also assumed that the physical form has to be modified to powder prior to spraying). Since PROC 21 and PROC 24 are considered as potential abrasive tasks, the emission potential is accordingly higher and the physical form is assumed to be wear dust during these tasks. |   |                        |                  |                    |  |  |  |  |  |
| PROC  | Use in preparation  | Content in preparation | Physical form    | Emission potential |  |  |  |  |  |
| PROC 11   | not restricted  |                        | powder           | medium             |  |  |  |  |  |
| PROC 21, 24   |   |                        | (wear) dust      | low – high         |  |  |  |  |  |
| All other applicable PROCs  |   |                        | pearls, granules | very low – low     |  |  |  |  |  |
| Amounts used  |   |                        |                  |                    |  |  |  |  |  |
| The actual tonnage handled per shift is not considered to influence the exposure as such for this scenario. Instead, the combination of the scale of operation (industrial vs. professional) and level of containment/automation (as reflected in the PROC) is the main determinant of the process intrinsic emission potential.  |   |                        |                  |                    |  |  |  |  |  |
| Frequency and duration of use/exposure  |   |                        |                  |                    |  |  |  |  |  |
| PROC  | Duration of exposure  |                        |                  |                    |  |  |  |  |  |
| PROC 11   | Due to the high level of automation and measures at the process level (please see below), inhalation exposure is negligible and the exposure duration is consequently short (< 60 minutes).   |                        |                  |                    |  |  |  |  |  |
| All other applicable PROCs  | not restricted  |                        |                  |                    |  |  |  |  |  |
| Human factors not influenced by risk management   |   |                        |                  |                    |  |  |  |  |  |
| The shift breathing volume during all process steps reflected in the PROCs is assumed to be 10 m <sup>3</sup> /shift (8 hours).   |   |                        |                  |                    |  |  |  |  |  |
| Other given operational conditions affecting workers exposure   |   |                        |                  |                    |  |  |  |  |  |
| Other operational conditions such as room volume, indoor or outdoor use, process temperature and process pressure are not considered relevant for the occupational exposure assessment of the conducted processes.  |   |                        |                  |                    |  |  |  |  |  |

## Exposure scenario addendum for sodium hydrogensulfate

| Technical conditions and measures at process level (source) to prevent release   |  |   |  |  |
|--|--|---|--|--|
| PROC   | Level of containment   | Level of segregation  |  |  |
| PROC 2, 3  | closed process   | not required  |  |  |
| PROC 11  | closed process   | spraying in non-industrial settings has to be performed in segregated areas where direct exposure of the worker is excluded                           |  |  |
| Technical conditions and measures to control dispersion from source towards the worker   |  |   |  |  |
| PROC   | Level of separation  | Localised controls (LC)   | Efficiency of LC (according to MEASE)  | Further information  |
| PROC 11  | Any potentially required separation of workers from the emission source is indicated above under "Frequency and duration of exposure". A reduction of exposure duration can be achieved, for example, by the installation of ventilated (positive pressure) control rooms or by removing the worker from workplaces involved with relevant exposure. | Efficient ventilation of the area (e.g. local exhaust ventilation) is recommended to minimise any potential emission of wear dust into workplace air. | 78 %   | -  |
| All other applicable PROCs   | Separation of workers from the emission source is generally not required in the conducted processes.   |   |  |  |
| Organisational measures to prevent /limit releases, dispersion and exposure  |  |   |  |  |
| Avoid inhalation or ingestion. General occupational hygiene measures are required to ensure safe handling of the substance. Good occupational hygiene practices have to be followed (e.g. shower and change clothes at end of work shift) to avoid any contamination of private households via the work-home-interface. Do not eat and smoke in the workplace. Unless otherwise stated below, wear standard working clothes and shoes. Do not wear contaminated clothing at home. Do not blow dust off with compressed air. Regular training in workplace hygiene practice and proper use of personal protective equipment is required.  |  |   |  |  |
| Conditions and measures related to personal protection, hygiene and health evaluation  |  |   |  |  |
| PROC   | Specification of respiratory protective equipment (RPE)  | RPE efficiency (assigned protection factor, APF)  | Specification of gloves  | Further personal protective equipment (PPE)  |
| All applicable PROCs   | If ventilation is insufficient and/or formation of relevant dust levels cannot be excluded, use RPE according to EN143 and EN149. An FFP2 mask should be worn for safety reasons when packaging/unpacking sodium hydrogensulfate since high abrasion may occur.  | (APF=10, for safety reasons during processes where relevant dust levels and high abrasion may occur)  | In cases where extensive direct contact with sodium hydrogensulfate cannot be avoided, wear suitable protective gloves according to EN374. | Eye protection equipment (e.g. goggles or visors) conforming to EN166 must be worn, unless potential contact with the eye can be excluded by the nature and type of application (i.e. closed process). Additionally, face protection, protective clothing and safety shoes are required to be worn as appropriate. |
| <p>Any RPE as defined above shall only be worn if the following principles are implemented in parallel: The duration of work (compare with "duration of exposure" above) should reflect the additional physiological stress for the worker due to the breathing resistance and mass of the RPE itself, due to the increased thermal stress by enclosing the head. In addition, it shall be considered that the worker's capability of using tools and of communicating are reduced during the wearing of RPE.</p> <p>For reasons as given above, the worker should therefore be (i) healthy (especially in view of medical problems that may affect the use of RPE), (ii) have suitable facial characteristics reducing leakages between face and mask (in view of scars and facial hair). The recommended devices above which rely on a tight face seal will not provide the required protection unless they fit the contours of the face properly and securely.</p> <p>The employer and self-employed persons have legal responsibilities for the maintenance and issue of respiratory protective devices and the management of their correct use in the workplace. Therefore, they should define and document a suitable policy for a respiratory protective device programme including training of the workers.</p> <p>An overview of the APFs of different RPE (according to BS EN 529:2005) can be found in the glossary of MEASE.</p> |  |   |  |  |

## Exposure scenario addendum for sodium hydrogensulfate

| 2.2 Control of environmental exposure   |   |                                    |   |                                |
|---|---|------------------------------------|---|--------------------------------|
| <b>Amounts used</b>   |   |                                    |   |                                |
| The daily and annual amount per site (for point sources) is not considered to be the main determinant for environmental exposure. In this scenario the emissions of NaHSO <sub>4</sub> are considered in lower amounts and on a larger scale due to professional and/or consumer use. |   |                                    |   |                                |
| <b>Frequency and duration of use</b>  |   |                                    |   |                                |
| Due to the wide dispersive aspect of the scenario a continuous release is assumed.  |   |                                    |   |                                |
| <b>Environment factors not influenced by risk management</b>  |   |                                    |   |                                |
| Flow rate of receiving surface water: 18000 m <sup>3</sup> /day   |   |                                    |   |                                |
| <b>Other given operational conditions affecting environmental exposure</b>  |   |                                    |   |                                |
| Effluent discharge rate of the STP: 2000 m <sup>3</sup> /day  |   |                                    |   |                                |
| <b>Technical onsite conditions and measures to reduce or limit discharges, air emissions and releases to soil</b>   |   |                                    |   |                                |
| No risk management measure can be assumed for professional and/or consumer uses. All waste water resulting from use (cleaning, pH-regulator in swimming pools) of NaHSO <sub>4</sub> is assumed to be directed to a municipal STP (default setting according to ECHA guidance R16).   |   |                                    |   |                                |
| <b>Conditions and measures related to waste</b>   |   |                                    |   |                                |
| Not relevant  |   |                                    |   |                                |
| 3. Exposure estimation and reference to its source  |   |                                    |   |                                |
| <b>Occupational exposure</b>  |   |                                    |   |                                |
| PROC  | Method used for inhalation exposure assessment (refer to introduction)  | Inhalation exposure estimate (RCR) | Method used for dermal exposure assessment  | Dermal exposure estimate (RCR) |
| All applicable PROCs  | Since sodium hydrogensulfate has a low dustiness (<1 % as obtained in rotating drum testing), inhalation exposure during all process steps is assumed to be negligible if the proposed risk management measures as described above are met.   |                                    | Due to the negligible dermal absorption of sodium hydrogensulfate, the dermal route is not a relevant exposure path for sodium hydrogensulfate and a dermal DNEL has not been derived. Thus, dermal exposure is not assessed in this exposure scenario. |                                |
| <b>Environmental emissions</b>  |   |                                    |   |                                |
| Environmental emissions   | Wide dispersive uses of NaHSO <sub>4</sub> usually use diluted products. The small amounts of NaHSO <sub>4</sub> will entirely end up in the sewer where they will further be neutralized quickly by the buffer capacity of the wastewater before reaching a STP or surface water. The influent of a municipal STP is typically tested for pH and, if needed, adjusted before entering the biological step. The effluent of a municipal STP is usually circumneutral.   |                                    |   |                                |
| Exposure concentration in waste water treatment plant   | Since the municipal STP usually monitors the pH of the influent and neutralize accordingly if needed, there is no pH impact expected on the microbiological activity in the municipal STP.  |                                    |   |                                |
| Exposure concentration in aquatic pelagic compartment   | When NaHSO <sub>4</sub> is emitted to surface water, sorption to particulate matter and sediment will be negligible. When NaHSO <sub>4</sub> is rejected to surface water, the pH may decrease, depending on the buffer capacity of the water. The higher the buffer capacity of the water, the lower the effect on pH will be. In general the buffer capacity preventing shifts in acidity or alkalinity in natural waters is regulated by the equilibrium between carbon dioxide (CO <sub>2</sub> ), the bicarbonate ion (HCO <sub>3</sub> <sup>-</sup> ) and the carbonate ion (CO <sub>3</sub> <sup>2-</sup> ). |                                    |   |                                |
| Exposure concentration in sediments   | The sediment compartment is not included in this ES, because it is not considered relevant for NaHSO <sub>4</sub> : when NaHSO <sub>4</sub> is emitted to the aquatic compartment, sorption of to sediment particles is negligible.   |                                    |   |                                |
| Exposure concentrations in soil and groundwater   | The terrestrial compartment is not included in this exposure scenario, because it is not considered to be relevant.   |                                    |   |                                |
| Exposure concentration in atmospheric compartment   | The air compartment is not included in this CSA because it is considered not relevant for NaHSO <sub>4</sub> .  |                                    |   |                                |
| Exposure concentration relevant for the food chain (secondary poisoning)  | Bioaccumulation in organisms is not relevant for NaHSO <sub>4</sub> : a risk assessment for secondary poisoning is therefore not required.  |                                    |   |                                |

**4. Guidance to DU to evaluate whether he works inside the boundaries set by the ES**

**Occupational exposure**

The DU works inside the boundaries set by the ES if he handles sodium hydrogensulfate having the same properties with regard to dustiness as described in this ES and if the proposed risk management measures as described above are met. A dustiness assessment can be made either on a qualitative or on a quantitative basis. For a qualitative assessment the MEASE glossary ([www.ebrc.de/mease.html](http://www.ebrc.de/mease.html)) can be consulted, which provides guidance on this topic. A quantitative assessment can be done by conducting a dustiness test with the specific material according to the rotating drum method. It is however noted that also other dustiness tests exist, which may be used instead. For further details please refer to the European Standard EN 15051 titled "Workplace atmospheres – Measurement of the dustiness of bulk materials – Requirements and reference test methods".

**Environmental emissions**

not relevant for consumers/professionals

### 9.3 Consumer use of cleaning products containing sodium hydrogensulfate

| Route of exposure  | Method used, comments   |                          |                   |  |  |  |  |  |
| Oral   | Qualitative assessment<br>Oral uptake of sodium hydrogensulfate via the use of household cleaning products is considered negligible under normal handling conditions. |                          |                   |  |  |  |  |  |
| Dermal   | No local effects are known after dermal exposure. Furthermore, dermal absorption is considered negligible and   |                          |                   |  |  |  |  |  |

| <b>Appendix 2: Exposure Scenario Format (2) addressing uses carried out by consumers</b>  |   |
|---|---|
|   | there are no data available which indicate systemic toxicity following this route. Thus, dermal exposure is not assessed in this exposure scenario.   |
| Eye   | <p>Qualitative assessment<br/>Exposure to the eyes is not expected as part of the intended product use.<br/>Solid: As the product is of low-very low dustiness no dust formation is expected.<br/>Liquid: Splashes into the eyes cannot be excluded if no protective goggles are worn during the application. However, this will mainly be to the diluted application solution (&lt;1% NaHSO<sub>4</sub>). Therefore mild irritation can easily be avoided by immediate rinsing of the eyes with water.</p> |
| Inhalation  | Sodium hydrogensulfate has a low dustiness (<1 % as obtained in rotating drum testing), therefore inhalation exposure during use of solid sodium hydrogensulfate pearls is assumed to be negligible. Thus, inhalation exposure is not assessed in this exposure scenario.   |
| <b>Environmental exposure</b>   |   |
| The pH impact due to use of sodium hydrogensulfate in household cleaning products is expected to be negligible. The influent of a municipal wastewater treatment plant is often neutralized anyway and sodium hydrogensulfate may even be used beneficially for pH control of basic wastewater streams that are treated in biological WWTPs. Since the pH of the influent of the municipal treatment plant is circum neutral, the pH impact is negligible on the receiving environmental compartments, such as surface water, sediment and terrestrial compartment. |   |
| <b>4. Guidance to DU to evaluate whether he works inside the boundaries set by the ES</b>   |   |
| The DU works inside the boundaries set by the ES if sodium hydrogensulfate is either marked as a liquid preparation or in case of a solid preparation sodium hydrogensulfate is used as manufactured and not further processed to get smaller particles.  |   |

## 9.4 Consumer use of sodium hydrogensulfate as pH-regulator for swimming pools

| Since sodium hydrogensulfate is classified as irritating to eyes (eye dam.1) a qualitative assessment has been performed for exposure   |  |                       |                    |  |  |  |  |  |

| <b>Appendix 2: Exposure Scenario Format (2) addressing uses carried out by consumers</b>  |  |
|---|--|
| to the eye.   |  |
| <b>Human exposure</b>   |  |
| <b>Use of pH-regulator for swimming pools</b>   |  |
| Route of exposure   | Method used, comments  |
| Oral  | <p>Qualitative assessment</p> <p>Oral uptake of sodium hydrogensulfate as pH-regulator of swimming pools is not considered under normal handling conditions.</p>   |
| Dermal  | No local effects are known after dermal exposure. Furthermore, dermal absorption is considered negligible and there are no data available which indicate systemic toxicity following this route. Thus, dermal exposure is not assessed in this exposure scenario.  |
| Inhalation  | Sodium hydrogensulfate has a low dustiness (<1 % as obtained in rotating drum testing), therefore inhalation exposure during use of solid sodium hydrogensulfate pearls is assumed to be negligible. Thus, inhalation exposure is not assessed in this exposure scenario.  |
| Eye   | <p>Qualitative assessment</p> <p>Exposure to the eyes is not expected as part of the intended product use.</p> <p>Solid: As the product is of low-very low dustiness no dust formation is expected.</p> <p>Liquid: However, splashes into the eyes cannot be excluded if no protective goggles are worn during the task described . Prompt rinsing with water and seeking medical advice after accidental exposure is advisable.</p>   |
| <b>Post-application ingestion:</b>  |  |
| Route of exposure   | Method used, comments  |
| Oral  | <p>Qualitative assessment:</p> <p>Sodium hydrogensulfate will dissolve in water to sodium and sulphate ions and will reduces the pH of the swimming pool water. If an equal distribution of the salt has been secured and the pH was measured to be in the desired range between 7.0-7.4 no local effects need to be suspected. No systemic effects are expected from the oral uptake, as these ions are omnipresent in nature and normal constituent of the human body.</p> |
| <b>Environmental exposure</b>   |  |
| The pH impact due to use of sodium hydrogensulfate as pH-regulator in residential swimming pools is expected to be negligible, as under normal use conditions the desired effect is to neutralize the pH of the swimming pool water. However, the influent of a municipal wastewater treatment plant is often neutralized anyway and sodium hydrogensulfate may even be used beneficially for pH control of basic wastewater streams that are treated in biological WWTPs. Since the pH of the influent of the municipal treatment plant is circum neutral, the pH impact is negligible on the receiving environmental compartments, such as surface water, sediment and terrestrial compartment. |  |
| <b>4. Guidance to DU to evaluate whether he works inside the boundaries set by the ES</b>   |  |
| The DU works inside the boundaries set by the ES if sodium hydrogensulfate is either marked as a liquid preparation or in case of a solid preparation sodium hydrogensulfate is used as manufactured and not further processed to get smaller particles.  |  |

## 10 Risk Characterisation

### 10.1 Industrial uses of NaHSO<sub>4</sub>

#### 10.1.1 *Occupational exposure*

Please refer to Section 3 of exposure scenario 9.1. Inhalation and dermal exposure have been addressed qualitatively in the absence of any DNELs (derived no-effect levels).

#### 10.1.2 *Environmental exposure*

As shown in the exposure scenario 9.1, no exposure to NaHSO<sub>4</sub> is expected to occur in sediments, soil and groundwater or atmospheric compartment.

#### 10.1.2.1 **Aquatic compartment (including microbiological activity in STP)**

The risk characterisation is only performed for the aquatic environment compartment, when applicable including STPs/WWTPs, as emissions of NaHSO<sub>4</sub> in the different life-cycle stages (production and use) mainly apply to (waste) water.

Discharges of NaHSO<sub>4</sub> from production and use to STPs/WWTPs and receiving waters are generally well controlled. Additionally, national regulations often require pH control of the wastewaters, to protect surface waters from pH changes. Where a significant pH change cannot be excluded, neutralisation of NaHSO<sub>4</sub> containing wastewaters and effluents applies.

Therefore, the aquatic compartment is adequately protected with respect to pH changes.

## 10.2 Wide dispersive uses of NaHSO<sub>4</sub>

### 10.2.1 *Occupational exposure*

Please refer to Section 3 of exposure scenario 9.2. Inhalation and dermal exposure have been addressed qualitatively in the absence of any DNELs (derived no-effect levels).

#### 10.2.2 *Environmental exposure*

#### 10.2.2.1 **Aquatic compartment (including microbiological activity in STP)**

The risk characterisation is only performed for the aquatic environment compartment and the municipal STPs, as emissions of NaHSO<sub>4</sub> in the different life-cycle stages mainly apply to (waste) water.

Discharges of NaHSO<sub>4</sub> from wide dispersive use to the STPs are generally quickly neutralized in the sewer. Additionally, the municipal STP will analyse the pH of the influent and effluent to protect the biological step in the STP and the receiving water from pH changes. Where a significant pH change cannot be excluded, neutralisation of NaHSO<sub>4</sub> containing wastewaters applies.

Therefore, the aquatic compartment is adequately protected with respect to pH changes.

## **10.3 Consumer uses of NaHSO<sub>4</sub>**

### **10.3.1 *Consumer exposure***

No quantitative assessment has been performed; therefore no risk characterisation ratio (RCR) has been derived.

Regarding the irritant effect to the eyes sodium hydrogensulfate can be allocated to the severe hazard category on the basis that exposure to such irritant substances should be avoided. Exposure to the eyes is not expected as part of the intended product use. However, accidental splashes cannot be excluded. However, it can be assumed that this would be to the diluted form rather than the concentrate. Therefore, mild irritation can easily be avoided by immediate rinsing of the eyes with water.

### **10.3.2 *Environmental exposure***

Consumer uses relate to already diluted products which will further be neutralized quickly in the sewer, well before reaching a WWTP or surface water. The influent of municipal treatment plants is usually neutralized anyway. Therefore, consumer use of sodium hydrogensulfate is adequately under control for the environment.
